

How lucky I am to live today, in the year 2100 and not, for example, one hundred years ago. Our contemporary world is a paradise compared to the one in the 20-th century, according to what I have learnt during the history lessons dealing with past civilizations. Are you curious to learn about the turning point?

As you know, primitive communities, like those of human beings, tend to organize some weird games or competitions called "wars". People used to enjoy them quite often throughout the centuries but in 1999 a ferocious nuclear war broke out. Due to great radioactivity, almost all species became extinct, including *Homo sapiens*. However, there was no substantial damage to the globe.

Thanks to unusual endurance some kinds of bacteria managed to survive. Far-reaching mutations enabled our ancestors to develop impressive intelligence. Owing to a very high rate of reproduction and a relatively short life span, we have been developing pretty fast - it took us only 50 years to outdo the level of the previous civilization.

Now we are really enjoying our lives. Can you imagine a world without any wars, famine, or poverty? We live in perfect harmony, feeding on carbon dioxide and making love to each other. As we are rich spiritually, we do not care for material things.

All in all, life could not be happier these days.
